## **Rover Technology Fusions Joins National Association of Court Management**

*(Tampa, FL – February 27, 2009)* – Rover Technology Fusions (RTF), a Tampa technology solutions provider, announces its' new membership to the NACM (National Association of Court Management).

Rover Technology Fusions joined the association because NACM helps drive and formulate new initiatives in the modernization of Court technologies. "The Association offers us the best in educating our staff on what is really important to the Courts as they continually look to improve workflow process" said Bob Letzeisen, VP of Business Development at RTF. "When building technology solutions organizations have to thoroughly understand the areas of business improvements the customer is focused on, and not design products in a vacuum. NACM clearly is a source of education to help technology firms build products the market is looking for. The 2008 conference helped RTF better understand how our products fit into the Paper on Demand goals that enhance the Courts' focus to be more conscious of minimizing paper and the number of times it is copied or printed. "We all want to be a bit "greener" these days because it is good business" he went on to say.

Rover's product line Rover INK™, is a suite of productivity solutions delivering effective mobile data capture and processing. Rover INK easily transitions plain paper-based data collection into digital paper and digital pens minimizing cost and expediting document distribution without the need of scanning. The process also eliminates the costs and time involved in data entry as the Rover INK product instantly converts the handwritten information to typed digital format.

### **About Rover Technology Fusions**

Rover Technology Fusions (RTF) is a full-service technology solutions provider offering a robust portfolio of products and services to both small and large businesses. RTF develops and integrates affordable enterprise technologies that connect business partners and protect their valuable business data. With a strong focus on improving workflow processes along with the security and confidentiality of customer data, RTF web-based solutions deliver "on the edge" communication with quick to implement backup and remote access systems.
